String Length

A String in Java is actually an object, which means it contains **methods** that can perform certain operations on strings.

For example, you can find the length of a string with the **length()** method:

```
String txt = "ABCDEFGHIJKLMNOPQRSTUVWXYZ";  
System.out.println("The length of the txt string is: " + txt.length());
```

More String Methods

There are many string methods available in Java.

For example:

- The `toUpperCase()` method converts a string to **upper case** letters.
- The `toLowerCase()` method converts a string to **lower case** letters.

Example

```
String txt = "Hello World";  
System.out.println(txt.toUpperCase()); // Outputs "HELLO WORLD"  
System.out.println(txt.toLowerCase()); // Outputs "hello world"
```

Finding a Character in a String

The `indexOf()` method returns the **index** (the position) of the first occurrence of a specified text in a string (including whitespace):

```
String txt = "Please locate where 'locate' occurs!";  
System.out.println(txt.indexOf("locate")); // Outputs 7
```

Java counts positions from zero.

0 is the first position in a string, 1 is the second, 2 is the third ...

You can use the `charAt()` method to access a character at a specific position in a string:

Example

```
String txt = "Hello";  
System.out.println(txt.charAt(0)); // H  
System.out.println(txt.charAt(4)); // o
```

Comparing Strings

To compare two strings, you can use the `equals()` method:

Example

```
String txt3 = "Greetings";  
String txt4 = "Great things";  
  
System.out.println(txt1.equals(txt2)); // true  
System.out.println(txt3.equals(txt4)); // false
```

Removing Whitespace

The `trim()` method removes whitespace from the beginning and the end of a string:

Example

```
String txt = "  Hello World  ";  
System.out.println("Before: [" + txt + "]");  
System.out.println("After:  [" + txt.trim() + "]");
```

Result:

```
Before: [  Hello World  ]  
After:  [Hello World]
```
