

Java Comparison Operators

[< Previous](#)[Next >](#)

Comparison Operators

Comparison operators are used to compare two values (or variables). This is important in programming, because it helps us to find answers and make decisions.

The return value of a comparison is either **true** or **false**. These values are known as *Boolean values*, and you will learn more about them in the [Booleans](#) and [If..Else](#) chapter.

In the following example, we use the **greater than** operator (**>**) to find out if 5 is greater than 3:

Example

[Get your own Java Server](#)

```
int x = 5;
int y = 3;
System.out.println(x > y); // returns true, because 5 is higher than 3
```

[Try it Yourself »](#)

A list of all comparison operators:

≡	.	CSS	JAVASCRIPT	SQL	PYTHON	JAVA	PHP	HOW TO	W3.CSS	C
!=		Not equal				x != y			Try it »	
>		Greater than				x > y			Try it »	
<		Less than				x < y			Try it »	
>=		Greater than or equal to				x >= y			Try it »	
<=		Less than or equal to				x <= y			Try it »	

Real-Life Examples

Comparison operators are often used in real-world conditions, such as checking if a person is old enough to vote:

Example

```
int age = 18;

System.out.println(age >= 18); // true, old enough to vote
System.out.println(age < 18);  // false, not old enough
```

Try it Yourself »

Another common use is checking if a password is long enough:

Example

```
int passwordLength = 5;
```
